The Outcome

Where to go from here

- Although the original intent was to develop the new model solely in PL/SQL, the combination of staff and time resource constraints led to developing a “prototype” of the system a bit differently than initially planned
- Because result sets were available for several components (e.g., graduation rates, test participation, etc. . .) there wasn’t a need to develop scripts/programs for these areas; however, this would change over the course of the year
- So the workload was split: information systems staff would assemble the data needed into a flat file and I would have responsibility for the implementation of the “business rules” and computations
- Given the set of rules/operational definitions, it seemed like it would be fairly feasible; then we started working with the data and getting reminders about existing SBE and federal policies that also needed to be incorporated into the design

Mutually Exclusive Completely Exhaustive (MECE) operational definitions

- Because the State's student information system acquires data through batch XML processing on a roughly monthly basis, there were problems with some data that could not be reconciled at entry

Data Architecture for Stata
Data Management and Rule Implementation
Calculations
MegaReporting = LaTeX2ε + Bash

The Outcome

Where to go from here

- Because the State's student information system acquires data through batch XML processing on a roughly monthly basis, there were problems with some data that could not be reconciled at entry
 - For example, students who enrolled and/or withdrew from one school to another during the first month of school are not able to be tracked as accurately as we would like
 - Due to the batch process that is used validation checks that could prevent some of these issues aren't always available
 - Since the definition of Full Academic Year is a function of the percentage of calendar days enrolled in a school/district, this led to many cases where the enrollment window could not be closed
- Additional challenges regarding the handling of special cases of student scores would have reduced sample sizes to the point where any estimates would have been highly unstable

MECE (continued)

example

Student ID	District ID	School ID	Date	Code
000123456	0001	020	09aug2013	E1
000123456	0001	024	19aug2013	E1
000123456	0001	020	10sep2013	T2
000123456	0002	016	20oct2013	E4
000123456	0001	024	20oct2013	T3
000123456	0002	016	13apr2014	T8

- Codes beginning with an E represent different classifications of enrollments
- Codes beginning with a T represent different classifications of transfers
- For the original prototype, these data were originally stored in a wide format in the same flat file/table as the assessment data
- In cases like the first three observations, there was no way to determine when to close the enrollment window without making assumptions about which data were “true” and/or “correct” and which were not
- Since the first file submission from districts covers August and September, there isn’t a good/clean way of reconciling the records when they enter the data system without substantial time/effort that would have a negative effect on system performance

The Outcome

Where to go from here

- Federal law requires students to be assessed in grades 10-12 but advanced students may take these assessments prior to those grades
- To work around this, many states have adopted a “banking” model where the associated score on the high school assessment is “deposited” until the student is in the 10th grade and “withdrawn” for application
- Some data elements (e.g., enrollment/transfer records, monthly enrollment histories, etc. . .) were best suited for a “long” file format, while the assessment data were easier to store in a “wide” format

Changes From the Prototype

- The prototype versions of the Stata programs did not include any capabilities to aggregate results to subgroups within schools/districts/state

Where to go from here

- The final step before creating the reports is the assignment of performance classifiers to schools and districts
- This phase in the overall workflow is also where “pseudo-imputation” is used to provide component scores for schools without sufficient data (e.g., < 10 Students) using the results for the district

The Outcome

Where to go from here

- The final step before creating the reports is the assignment of performance classifiers to schools and districts
- This phase in the overall workflow is also where “pseudo-imputation” is used to provide component scores for schools without sufficient data (e.g., < 10 Students) using the results for the district
- In this phase a scale linking occurs for special cases of primary grade schools that do not have science assessment results
- A recent addition to this program — at the request of a district superintendent — is adding percentile rankings for each component score to the output file; the results are also classified into quintiles which are used to define fill colors for cells in the reports

Visualizing Comparisons for Schools, LEAs, & the Public

Efficiency Gains from Stata

Comparing the code bases

Area	# Scripts	# Data Files
Growth	32	80
Graduation Rates	23	75
AYP [†]	81	119
ESEA (Federal Law)	16	22

[†] Various aggregated proportions of achievement levels/participation rates on standardized tests

- The process of estimating growth previously required the use of 32 static SAS Scripts; Now ... it is completed with 1 .ADO file.
- Graduation Rates previously used 23 static SAS Scripts; Now ... it can be completed with 2 .ADO files.
- Proficiency/Participation Rate Measures used > 50 Scripts previously. Now ... it is completed with 2 .ADO files.

MegaReporting = LaTeX2ε +
Bash

The Outcome

Where to go from here

- In addition to reducing the code base, the use of ADO files should also reduce long term maintenance (so long as the rules don't change)
- The migration also gives the agency the flexibility to deploy open sourced toolkits developed by the Strategic Data Project
<http://www.gse.harvard.edu/sdp/resources/toolkit.php> for measuring and leveraging existing data to drive human capital policies/practices as well as inform policies, practices, and program development to support college and career readiness goals

Ease of use for additional end-users

Menu/Dialog Driven Interface

ADO Files !!!
Workflow Overview
Getting Data Into Stata
Time Series Functions to the
Rescue
Data Architecture for Stata
Data Management and Rule
Implementation
Calculations
MegaReporting = $\LaTeX 2\epsilon$ +
Bash

The Outcome

Where to go from here

- Although Stata may be user friendly to folks accustomed to working in the Stata environment, scripting languages can often be intimidating for many folks in the education sector whose only experience with analytic software is Some Program for Some Statistics and/or spreadsheet-based programs
- While dialog programming in Stata may not be the easiest, creating menu driven systems can make the interface more welcoming to novice users
- Stata is also still fairly new to the education sector in general and many graduate training programs in education tend to favor Some Program for Some Statistics even though it is a less robust platform for analysis and development

Optimizing the code base

computations/data management

Background

New Legislation
Old System

The Solution

ADO Files !!!
Workflow Overview
Getting Data Into Stata
Time Series Functions to the
Rescue
Data Architecture for Stata
Data Management and Rule
Implementation
Calculations
MegaReporting = LaTeX2ε +
Bash

The Outcome

Where to go from here

- Since a few of the operations take several minutes to run, it would be great to push some of the computations into Mata
- Currently working on refining the SQL codebase to force queries to return SIF values for date fields (e.g.,
`TO_NUMBER(TO_DATE('09012014', 'MMDDYYYY') - TO_DATE('01jan1960', 'DDmmmYYYY')) = 19967`) to reduce cleaning/formatting operations on the Stata side of things
- Because of the tight development timeline, the majority of the code took the “brute force” approach so there are likely to be numerous opportunities for code optimization

Adding more robust support for data visualization

Data Architecture for Stata

Data Management and Rule

Implementation

Calculations

MegaReporting = LaTeX2ε +

Bash

The Outcome

Where to go from here

- One of the biggest runtime efficiency challenges is in graph creation
- Currently all of the graphs are static, but I'm hoping that I'll learn enough about `stata2d3` during the conference to change that a bit more
- I also hope to better integrate tools like QGIS and/or `spmap` (Available from SSC) to develop data products for public consumption

Workflow Overview
Getting Data Into Stata
Time Series Functions to the
Rescue
Data Architecture for Stata
Data Management and Rule
Implementation
Calculations
MegaReporting = LaTeX2ε +
Bash

The Outcome

Where to go from here

- Used some of the existing examples of building .smcl-based presentations as a starting point
- Replaced nearly all code with hypertext to reduce end-users' anxiety of script-based software and allow them to get an idea of what the software is capable of without having to learn to code first
- After some initial participant feedback, added two sub-routines that would allow users to fetch data sets created with `aisa` (Written by S Kolenikov) and a routine that would launch video tutorials in Stata
