

Stata export for metadata documentation

Munich, 26.05.2019

Anne Balz, Klaus Pforr, Florian Thiroff

Motivation

- German Microdata Lab (GML) offers Metadata for various official microdata online

- Goal: extract Metadata from these Datasets automatically and import them into our database
 - ▶ German Microcensus
 - ▶ European Labour Force Survey
 - ▶ EU-SILC (European Union Statistics on Income and Living Conditions)

Microdata-Informationsystem MISSY

- Online plattform („MISSY-web“)
- Documentation of official microdata (European & national)
- Documentation on different levels:
 - ▶ study
 - ▶ question
 - ▶ variable

the meta-file

All necessary (meta-)information in a table format:

- Variable level
 - ▶ Varname, -label
 - ▶ Summary statistics (min, max, mean, std)
- Value level
 - ▶ Value, - label
 - ▶ Frequencies and percentages
 - Overall
 - For groups (e.g.: countries)

ado dta2md

Syntax

```
dta2md output(filename) freqvarlist(varlist) input(filename) [ group(varname) replace missingdef(exp) smissingdef(exp) ]
```

Arguments	Description
<u>output</u>	specifies where the metadata file is saved.
<u>freqvarlist</u>	list of variables for which information on value level is computed.
<u>input</u>	specifies where the Stata system file which is converted.
<u>group</u>	specifies group variable across which meta data are stratified.
<u>replace</u>	specifies if output file replaces existing file.
<u>missingdef</u>	specifies definition which non-system-missing are considered as .
<u>smissingdef</u>	specifies where the Stata system file which is converted.
<u>relation</u>	specifies where the Stata system file which is converted.
<u>matrix(name[, subopts])</u>	tabulate matrix name
<u>e(name[, subopts])</u>	tabulate matrix e(name)
<u>r(name[, subopts])</u>	tabulate matrix r(name)

Description

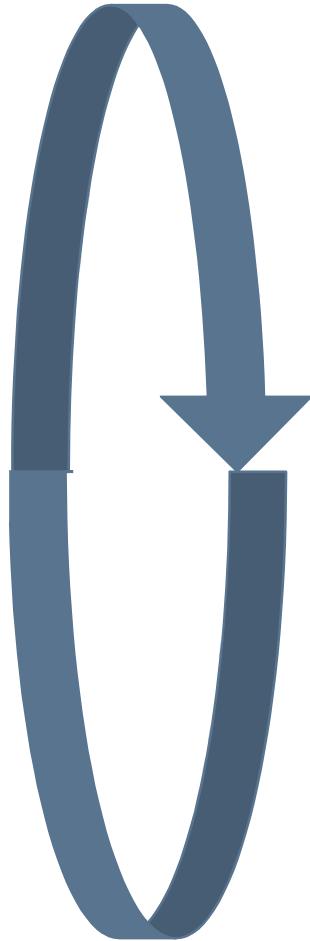

dta2md converts a Stata system file to metadata.

ado dta2md

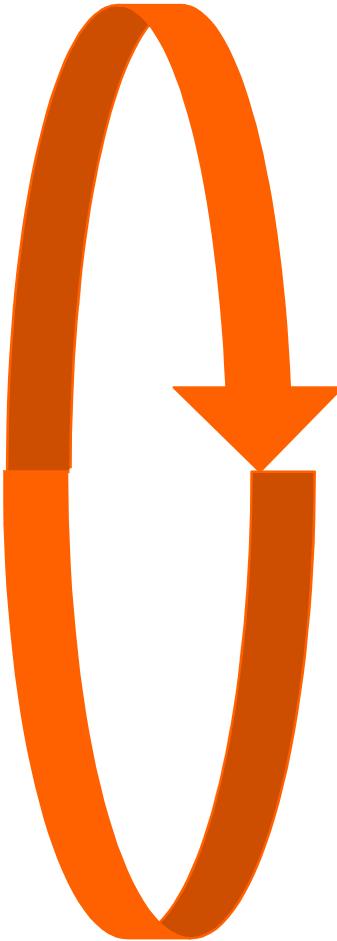

```
dta2md input(filename) output(filename) //  
    freqvarlist(varlist) //  
    [group(varname) //  
    missingdef(string) smissingdef(string) //  
    replace ]
```

```
dta2md input($path/micro_file.dta) output($path/meta_file.dta) //  
    freqvarlist(var1 var2 var3) //  
    group(country) //  
    missing("X<0") //  
    smissingdef(`"X=""invalid answer" | X=""did not understand""') //  
    replace
```

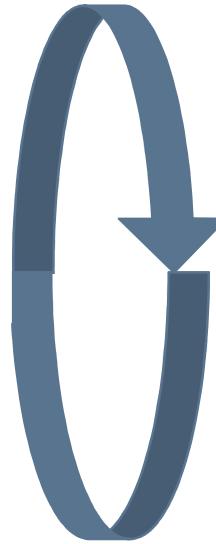

ado dta2md

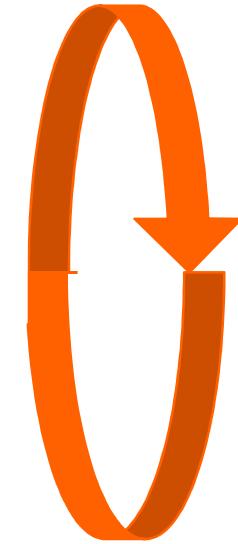

Loop over all vars

If group specified:
Loop over all groups

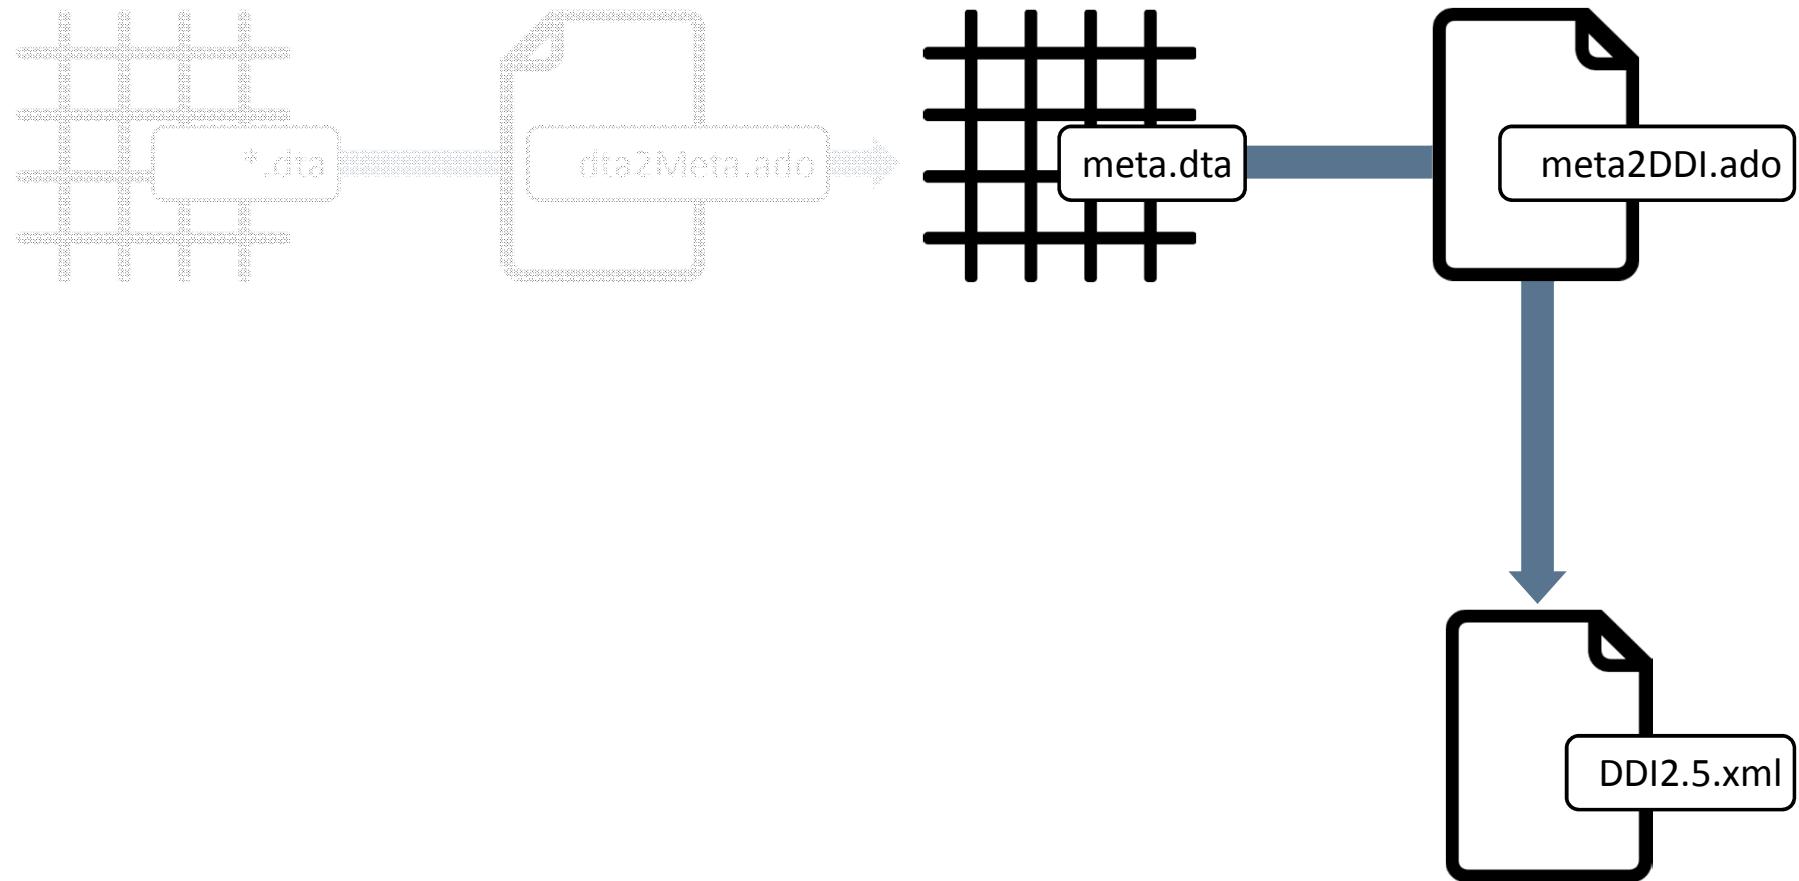

If computed:
Loop over all levels
(within all vars)

If group specified:
Loop over all groups
(within levels of vars)

ado meta2DDI

ado meta2DDI

ado meta2DDI

- Uses the *,file* command
- *,forvalues* to run through all categories
- variables of the meta-file are used to form hierarchical output
- example:
 - ▶ *,first* (0/1) tags first category of a variable
 - used to generate output on variable level

```
if (first[`i']) == 1 {  
quietly file write ddiOutputLog"      <var ID="">"  
quietly file write ddiOutputLog (varName[`i'])  
quietly file write ddiOutputLog"--"  
quietly file write ddiOutputLog (group[`i'])  
quietly file write ddiOutputLog"" name=""  
quietly file write ddiOutputLog (varName[`i'])  
quietly file write ddiOutputLog"" intrvl=""  
    if (computed[`i']) == 1 {  
quietly file write ddiOutputLog"discrete"  
    }  
    else {  
quietly file write ddiOutputLog"contin"  
    }  
quietly file write ddiOutputLog"">"' _n  
* Label  
quietly file write ddiOutputLog"      <lab1>"  
quietly file write ddiOutputLog (variableLabel[`i'])  
quietly file write ddiOutputLog"</lab1>"_n
```
