The Effects of Interaction Between Location of Birth and Location of Study on Immigrant Workers' Wages in Canada

Canada's Capital University

ABSTRACT

Previous studies have suggested that the wage gap between immigrants and the native-born can be accounted for by human capital factors including education and work experience and more importantly where they are acquired. However, current Canadian economic immigration policies do not consider either a potential immigrant's location of birth or their location of study.

In this paper, we study the effects of the interaction between a worker's location of birth and location of study on their wage with data from the 2011 National Household Survey. Using both OLS and median regression LAD, performed in STATA, we show that: (1) location of birth is generally not indicative of worker's earning (2) without the interactions, all foreign degrees lead to a lower wage compared to Canadians, with a U.S. degree being the least punitive (3) a U.S. degree would lead to a wage premium for workers from some countries, and (4) when a worker from a non-traditional foreign student source country receives a degree in a culturally and geographically distant location, there is a significant wage premium.

INTRODUCTION

Research Question: How the interaction of the location of education and the location of birth affects earnings of workers?

- **Motivation:** Canadian economic immigration system awards Additional points for Canadian degrees.
- Same points for foreign degrees regardless where it is obtained.
- No points for country origin.

DATA

- Our data comes from the **2011 National Household Survey**.
- Voluntary cross-sectional data for 21% of population (Canadian citizen, landed immigrants, and non-immigrants).
- Restricted to18-64 years old / degrees higher than high school / full-time job / positive income.
- Includes education level, work experience, years since immigration, knowledge of official languages and gender.

 $\ln w_i$: the logarithm of wage of worker *i* I_i : indicates if the person is an immigrant BL_i : vector of locations of birth u_i : the stochastic disturbance term

- Ordinary Least Squares (OLS): Card (1999) suggests that OLS method, despite its flaws, is a suitable tool with modest biased for estimating the return to education.
- Least Absolute Deviation (LAD): noticeable skewness of the distribution of log wage. LAD emphasizes on median instead of average as in the case of OLS. It is more robust to outliers than OLS and would produce great comparison estimates.

METHODOLOGY

Model

- Based on the empirical immigration framework used by Fortin et al (2016) we add the interaction of "location of birth" and "location of Study". We have:
 - $ln w_i = \alpha_c + \alpha I_i + X'\beta + \lambda BL_i + \delta SL_i + \gamma BL_i * SL_i + u_i$
- X_i : vector of socioeconomic characteristics incl. education/work experience/language/gender.
- SL_i : vector of locations of highest level of study
- $BL_i * SL_i$: signifies the interaction between locations of birth and locations of study

With median regression LAD, U.S. degree gives wage premium for India/Europe/Other Americas/Africa-born.

Significant wage premium: a worker from non-traditional foreign student source country with education in a culturally and geographically distinct country.

But reversed effect for those who are from traditional foreign student source country.

CONCLUSIONS

• The inclusion of the interaction variables does not alter relationship significantly per previous studies except knowledge of official language.

A worker's location of birth largely does not play a significant role in their wage with a few notable exceptions. (U.K. born experiences wage premium).

Overall, a worker with a foreign degree (regardless where) receives lower wage.

Punitive effect from a foreign education comes from the interactions between birth location

• We find that there is no overwhelming evidence to suggest any universally best location of study for a worker in terms of earning potential.

U.S. degree offers best outcome in certain cases.

Worker from a non-traditional foreign student source country goes to a culturally and geographically distinct country to study, they would expect to experience a large wage

The opposite is true for those from traditional foreign student source country.

POLICY IMPLICATIONS

No preference for country origin since it largely doesn't matter to potential wage in Canada. In general, immigrants with foreign degrees are expected to receive lower wages. U.S. degree is the least punitive.

U.S. degrees should be given preference as U.S. degree has most earning potential for workers with diverse backgrounds.

Immigrants with diverse background should be prioritized (from non-traditional source but with a degree from culturally and geographically distinct location)
