Syllabus

EC379.01 - Financial Economics  Peter Ireland
Boston College, Department of Economics  Fall 2013

Tuesdays and Thursdays, 12:00 - 1:15pm
Gasson Hall, Room 210

Course Description

This undergraduate elective focuses on financial economics, with specific emphasis on asset pricing and the valuation of risky cash flows. After developing and studying the details of consumer decision-making under uncertainty, it uses that general framework as a basis for understanding both equilibrium and no-arbitrage theories of securities pricing, including the capital asset pricing model (CAPM), the consumption capital asset pricing model (CCAPM), Arrow-Debreu theories, martingale pricing methods, and the arbitrage pricing theory (APT).

Math

For reasons that will quickly become clear, verbal and graphical analyses are useful, but take us only so far when examining the multi-dimensional problems faced by investors who can allocate their funds across many risky assets like those traded in global financial markets today. Mathematical analysis is therefore essential for a full development of the theories listed above. For this class, you won’t need to start with mathematical tools that go beyond those presented in a college-level calculus class or statistical concepts that go beyond those developed in the statistics and econometrics courses that are already required for the economics major, but you will have to apply those tools and concepts on a daily basis, both in class and in working on the problem sets and exam questions. As when visiting a foreign country, reading a play by Shakespeare or a novel by William Faulkner, looking at abstract art, or listening to classical music, learning a “new language” can be tough going at first. But the more you practice the easier it gets, and soon – maybe sooner than you think – you’ll find yourself speaking that language fluently and with confidence.

Course Materials

My lecture notes, which will serve as the main text for the course, are freely available through the course webpage at http://www2.bc.edu/peter-ireland/ec379.html.

Much of the material from those lecture notes is also covered in an excellent textbook:

Danthine and Donaldson assume that you have a background in economics, finance, math, and statistics that is somewhat deeper and broader than I will for this class. Accordingly, a fruitful strategy might be to look at the lecture notes first, see the material as it is presented
in class, and then read the relevant chapters in the book to reinforce what you’ve already learned.

**Course Requirements and Grading**

Your grade for this course will be based on a series of problem sets (10%), a midterm exam (45%), and a final exam (45%).

The problem sets will be made available through the course webpage and your answers to the questions on those problem sets will be collected on dates announced ahead of time in class. Some of the problem sets will follow the material covered in class quite closely; others will highlight results that extend those covered in class. All of the problem sets will help you prepare for the exams.

While it is fine for you to work together with other students on the problem sets, I still expect you to hand in your own individual answers to each question. Also, if you do work with others, make sure that you fully understand the answers to each problem, keeping in mind that you will have to work individually on the exams.

The midterm exam will be held during our regular class meeting time on Thursday, October 24. The final exam will be held according to the University’s official final exam schedule on Friday, December 20, from 12:30 to 2pm.

Different from the problem sets, I will expect you to work independently on the exams without consulting with other people, inside or outside of this class. That is, I expect that the answers you will hand in for the exams will be yours and yours alone.

**Academic Integrity**

Please familiarize or re-familiarize yourself with the University’s policies on academic integrity, which can be found at [http://www.bc.edu/integrity](http://www.bc.edu/integrity), and take care to uphold these standards as they apply to your work for this course.

Along these lines, to repeat: while it is fine for you to work together with other students on the problem sets, I expect that your work on the midterm and final exams will be yours and yours alone.

**Policies on Absences**

Absences from class because of illness or important schedule conflicts are sometimes inevitable and should be fine so long as they are isolated in number. If you do miss class on any given day, you can check the course webpage to see the slides for the discussion you missed. If you miss class on a day on which a problem set is due, please either bring your answers to the next class meeting or drop them off in my Economics Department mailbox (Maloney Hall, Room 411).
Office Hours

I will announce my regular office hours (Maloney Hall, Room 444) shortly after the semester starts. You can always reach me by email at peter.ireland@bc.edu to ask a question or to make an appointment to talk in person.

Course Outline

A Introduction

1 Mathematical and Economic Foundations (Danthine and Donaldson, Ch.1)
2 Overview of Asset Pricing Theory (Ch.2)

B The Demand for Financial Assets

3 Making Choices in Risky Situations (Ch.3)
4 Measuring Risk and Risk Aversion (Ch.4)
5 Risk Aversion and Investment Decisions (Ch.5)
6 Modern Portfolio Theory (Ch.6)

C Equilibrium Pricing

7 The Capital Asset Pricing Model (Ch.7)
8 Arrow-Debreu Pricing: Equilibrium (Ch.8)
9 The Consumption Capital Asset Pricing Model (Ch.9)

D No-Arbitrage Pricing

10 Arrow-Debreu Pricing: No-Arbitrage (Ch.10)
11 Martingale Pricing (Ch.11)
12 Arbitrage Pricing Theory (Ch.13)
